

Project Rocky

About the rocket

Rocky is built from cheap materials such as pvc and abs... showcasing a sleek 2 meter design with front canards and back fins for stability it exhibits at each start a cool starting sequence where the fins move in a pre-recorded movement like the real deal ! there are also 2 modes you can switch from your phone thanks to the ESP-32 WiFi Capability:

Pre-Recorded Flight : fins movement following a pre-programmed path in the air

Active Gyro Stabilization : automatically adjusts the fins to fight the wind and stay straight.

actuated fins

Back Fins

Advanced Controller

Featuring a powerful **ESP32**

microcontroller capable of managing four high-speed servos while delivering live telemetry, this custom flight computer brings the rocket to life. Its primary role is executing precise actuation loops for the stabilization fins.

The system is powered directly via a 3S LiPo battery. With optimized power paths, the system boasts an estimated operational uptime of over 7 hours non-stop.
